Challenge & Solution

Usual ML workflow:

1. Data Loading
2. Preprocessing
3. Data Splitting
4. Model Training
5. Evaluation
6. ...

Problems: tedious,
time-consuming to set up

```
{  
  "preprocessing": [  
    {  
      "name": "PolynomialFeatures",  
      "args": {  
        "degree": 2,  
        "include_bias": false  
      }  
    },  
    {  
      "name": "StandardScaler",  
      "args": {}  
    }  
  ],  
  "model": {  
    "name": "LinearRegression",  
    "args": {}  
  }  
}
```

Example config

Static Datasets

Examples:

1. Memory demand of LLM inference
2. Mapping of train delays against time of year on the ECML.

Real-time Data

Back end

1. Storing and referencing datasets
2. Performing an ML routine based on the config
3. Returning predictions and performance score
